Customer Validation

Primary mouse pulmonary fibroblasts were treated with TGF- β 1 (HY-P7117) to induce (myo) fibroblastic differentiation. The mRNA levels of PTPN13 and NOX4 in the (myo) fibroblasts were significantly increased after treatment, accompanied by increased expression of the (myo) fibroblast marker protein α -SMA.

Organoid beads were cultured with supplements of Noggin (HY-P7086), R-spondin 1 (HY-P7114), FGF-4 (HY-P7014), FGF-basic (HY-P7066), SB-431542 (HY-10431), Laduviglusib (HY-10182). The size, shape, and composition of the kidney organoids were highly reproducible.

Recombinant Protein Expression Service

- One-stop service from gene design to protein preparation
- Independent research and development of a variety of high expression vectors and strains
- Professional R&D team of recombinant protein technology
- Providing customized services of high-purity protein from mg to g
- Large-scale protein production platform
